

Coming Up with Ideas

1.

I believe that Shyp is a combination of a Simplify idea and a Virtualize idea. The process of sending a package elsewhere becomes more streamlined when someone from their company comes to pick it up for the user, all while navigating the details of sending the package online through their website.

2.

Curofy has aspects of Virtualize, Simplify, Me Too ideas and Remix ideas. The concept is almost exactly the same as LinkedIn except for medical professionals which fulfills the conditions for a Me Too idea. It is making the process of finding jobs and putting it online, while also providing updated medical information which you could normally only find by actually speaking with a medical professional and making that digital as well. It meets the conditions for the Simplify idea because it takes a lot of medical information you'd have to do either a lot of research for or by asking a doctor and then putting all of that into an organized website or app. Finally, like I said earlier, it's very similar to LinkedIn and also includes ideas from Google where it has a database of information that is easily searchable.

3.

Using Product Hunt I found a new start up called Visiby which tracks a brands visibility on AI search platforms. I think this is an example of a Mission Almost Impossible due to the progression of new ideas forming from the relatively new creation of AI. I think this idea is feeding mainly into necessity since the owner of said brand would need to keep track of its popularity to ensure they are doing the proper marketing. I think this idea is very easy to monetize via a subscription based service. Overall, the idea is pretty simple to explain, it just tracks and organizes how well a brand gets recommended to a user when searched on AI. I wouldn't necessarily say that the problem that this is solving is connected to me or someone I know since no one I know is trying to start a company or brand. However, I do think that this has a large market since there are many many people in business or other related professions who try to create business all the time and need to track how well their marketing is doing. Finally, I wouldn't say the idea has a "secret sauce" per say as it is a relatively new but basic idea that I think could be used by a lot of potential new entrepreneurs.

Finding Your Product

A. Brainstorming

(All of these ideas revolve around the game Dungeons and Dragons since I am confident I could be motivated and achieve success in my design with this topic in mind.)

Problems	Solutions
New players often ask which ability check they should use.	Have an app where the user inputs what the character is attempting and the app tells you the likely check and explains why.
Players forget what happened during the last session.	The user will paste session notes or a transcription of the session and the app (using AI) would generate a recap.
Dungeon Masters have a hard time coming up with balanced encounters that are appropriate for the party level.	Users input the party composition and the monsters they want to include. Then the app calculates the difficulty and recommends changes to the monsters, environment, or adds reinforcements for the party.
Players go in directions or do things that the Dungeon Master didn't prepare for.	When the Dungeon Master runs into an unexpected situation, the app generates NPC interactions, skills checks, and possible encounters.
Players forget who has what item, what they need to do, or where they are going.	This website/app would be a shared dashboard between the party where they can enter their inventory, write down quests, NPC relationships, clues, locations, etc.

The idea that I am most connected to would be the shared party dashboard idea. I picked this idea because I know for a fact that every other idea in this list already exists but I haven't found a dashboard app tailored specifically for the players, only the Dungeon Masters have something similar to this idea. I highly doubt that I am the first person to come up with this idea but maybe the first to want to create an app just for this purpose. This would be highly sought after in the entertainment industry, specifically for those who play Dungeons and Dragons, regardless of the player's experience. Even in my own time playing this game, my friends and I usually just end up using some google application since it is relatively easy to use and free but flawed has its challenges since it's not specifically tailored to our needs within the game. With this idea, this product could become a frequently used tool in order to keep the campaign more organized and engaging.

B. Product Proposal

1. Describe the product you have come up with and the type(s) of ideas that apply to it.

The product that I have chosen to create is a website/app that allows multiple users (specifically in the context of Dungeons and Dragons) to have a shared dashboard where they can input information that they collect over the course of a campaign. The ideas for this product include Virtualize and Simplify, normally players take written notes and share with the group vocally, this product would transfer that to an online platform. The product also makes sharing with the other users incredibly intuitive by allowing everyone to look at the rest of the users data they input. This app could improve the experience of those who rely on the google applications which aren't as tailored to an average Dungeons and Dragons player.

2. How is your product personally relevant to you? Are you or is someone close to you connected to the idea or the related problem?

This product is personally relevant for me as well as people who are close to me. Almost all of my close friends play Dungeons and Dragons so this website/app would be of great interest not just to me but to them as well.

3. What problem will your product solve?

This product solves the problem of having a disorganized and forgetful note taking system. It allows for the users to all collaboratively input important information that can be seen by all of those in the party which reduces time spent asking irrelevant questions and keeps the players on track with the Dungeon Masters vision.

4. What type of website will your product be? (i.e., blog, business, brochure, etc.)

This product would likely be considered a portal, as it is a private work space for a Dungeons and Dragons group.

5. Is your product a painkiller or a vitamin? That is, does it address users' needs or emotions? Why?

This product most definitely addressed users' needs rather than their emotions since it stems from needing an easier method to keep track of events and notes.

6. Is your product easy to monetize?

Considering the monetization of this product, I'd say it could go either way. On one hand, I could see plenty of people needing an application like this and being willing to pay for it. But on the other hand, there would be free alternatives that plenty of users may lean toward if price is a consideration. Ads could be a possibility if not enough users would be willing to pay a subscription fee.

7. Is your product simple and easy to describe?

I think anyone who would want to use this product would find this very easy to understand. It is a streamlined note taking app that can house all necessary (or unnecessary) information for a Dungeons and Dragons campaign.

8. Who will be the likely users of your product? Does your product have a large market?

The likely users of this product would be Dungeons and Dragons players which is becoming an increasingly popular market.

9. Does your product have a legitimate secret sauce?

I do think that this product has a certain secret sauce to it, the idea is basic but I think that many people would love to see something like this, especially if it's free.
