A. Decision Tree

The “Find a Campaign” form on Party Ledger recommends a Dungeons and Dragons campaign type using the campaign name, experience level, and Dungeon Master preference entered by the visitor. The recommendation appears directly below the form.

Decision 1: Was a campaign name entered?

- Yes: Recommend searching for that named campaign because the visitor already knows what they want.
- No: Continue to experience and role preferences because no specific campaign was requested.

Decision 2: Is the visitor a beginner who does not want to be a DM?

- Yes: Recommend a beginner-friendly adventure as a player because it’s an easier way to learn.
- No: Continue to the DM preference because the visitor may want to lead or may have more experience.

Decision 3: Does the visitor want to be a DM and have an experience level selected?

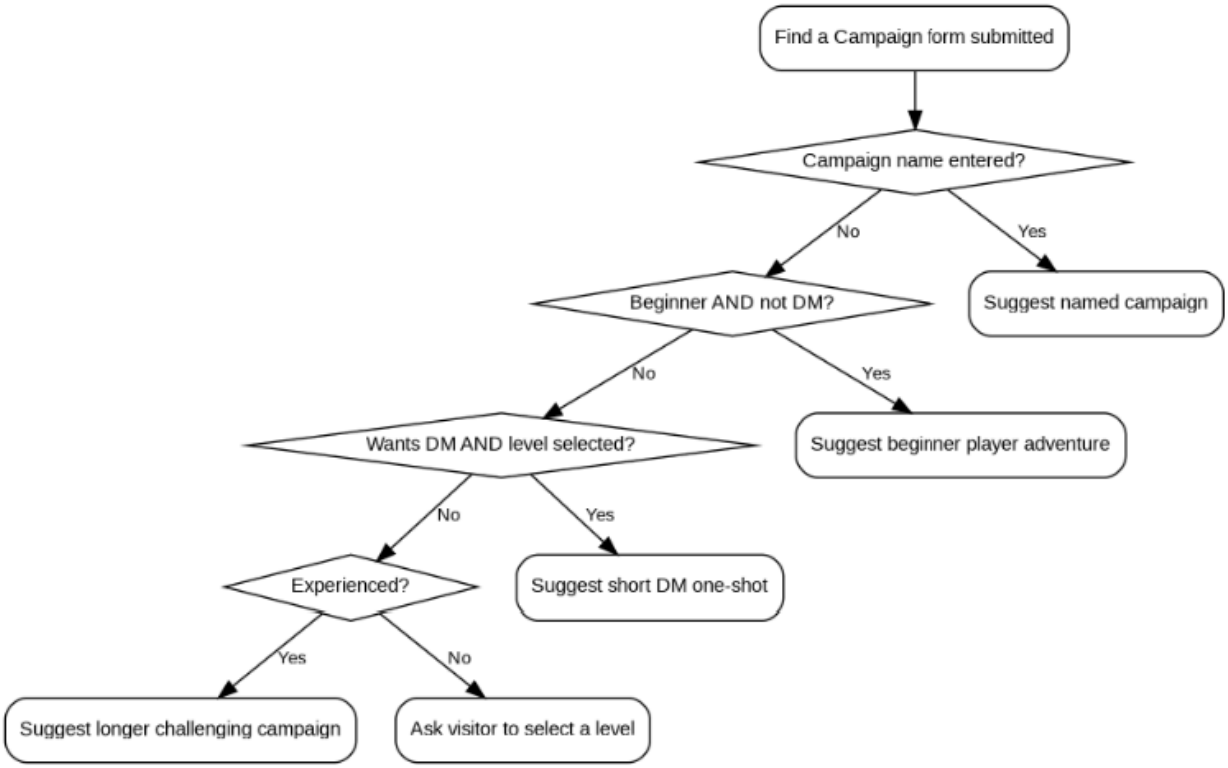

- Yes: Recommend running a short one-shot because its a manageable starting point for leading a game.
- No: Check whether the visitor is experienced since a more challenging campaign may be appropriate.

Decision 4: Is the visitor experienced?

- Yes: Recommend a longer and more challenging campaign because experienced players may enjoy more complex quests.
- No: Ask the visitor to select an experience level because there is not enough information for a tailored recommendation.

B. Flowchart

The flowchart shows the decision making process used by the Party Ledger recommendation feature. Diamonds represent decisions, rectangles represent the start and outcomes, and the arrows labeled “Yes” or “No” connect the different branches.
