For my Party Ledger website, I want to create a JavaScript feature on the Campaigns page that allows users to search for specific D&D campaigns. Users will be able to type a campaign name into a search bar, and the website will display campaigns that match what they entered. This will make it easier for users to find their campaigns without having to scroll through every campaign listed on the page.

The main goal of this script is to allow for easier navigation and interaction in the Campaigns page. Normally, the user would look through a long page of campaigns and have to scroll to find what they want but instead I want users to quickly search for the one they want. I also want the page to update based on what the user types without needing to reload the website.

1. Create a search bar on the Campaigns page using HTML.
2. Use JavaScript to get the text that the user enters into the search bar.
3. Compare the user's input to the names of the campaigns listed on the page.
4. If a campaign matches the search, display it on the page.
5. Hide any campaigns that do not match what the user searched for.
6. If no campaigns match the search, display a message saying that no campaigns were found.
7. If the search bar is empty, display all campaigns again.
